+Diatomaceous earth is a biochemical sedimentary rock; deposited from the cell wall of diatom; light yellow or light gray, soft and light texture, easily ground into powder; low density, porous, and extremely absorbent.

Wikipedia - Diatomaceous Earth

Diatoms can be used for photosynthesis and homemade organics. The main component of diatomite is silicic acid. There are numerous pores on the surface, which can adsorb and decompose the odor in the air, and have the functions of humidity control and deodorization. The products produced by using diatomaceous earth as raw materials not only have the characteristics of non-combustible, dehumidifying, deodorizing and permeability, but also purify the air, soundproofing, waterproofing and heat insulation.

Diatomaceous earth automatically adjusts the indoor humidity. It has the characteristics of super fiber, porous, etc., and its ultrafine pores are 5000 to 6000 times more than charcoal.
